message(1).txt

① $*$ → 0 or more
$+$ → 1 or more
{1, } → 1 or more
{2, 3} → between 2 and 3

② Max child processes. ✓

③ read - write fifo ✓

④ CPU - cores ✓

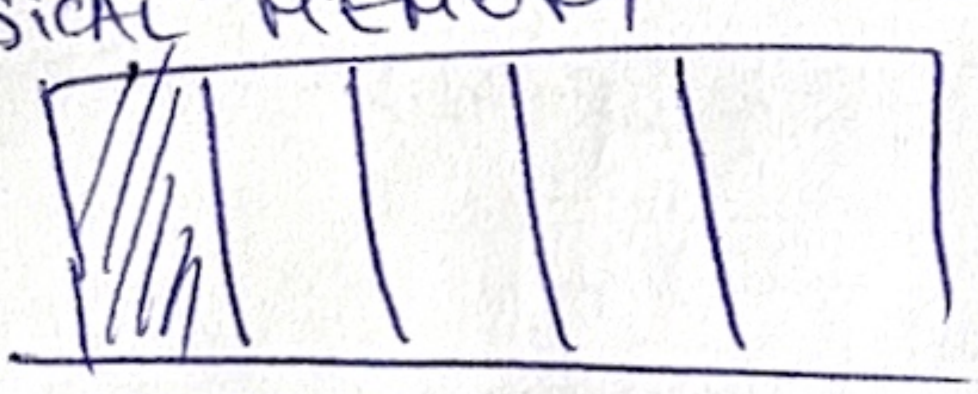
⑤ $T = N_1 = N_2 = N_3 = 1$

⑥ I/O operations will put the process that handles them on wait because they have to wait for the data to be ready for read / write. After I/O are executed, process gets back into ready state waiting for the CPU to be scheduled

read → from the disk handler
write → to the data storage of the disk handler

✓ ⑦ Paged allocation vs variable partition allocation.

LOGICAL MEMORY

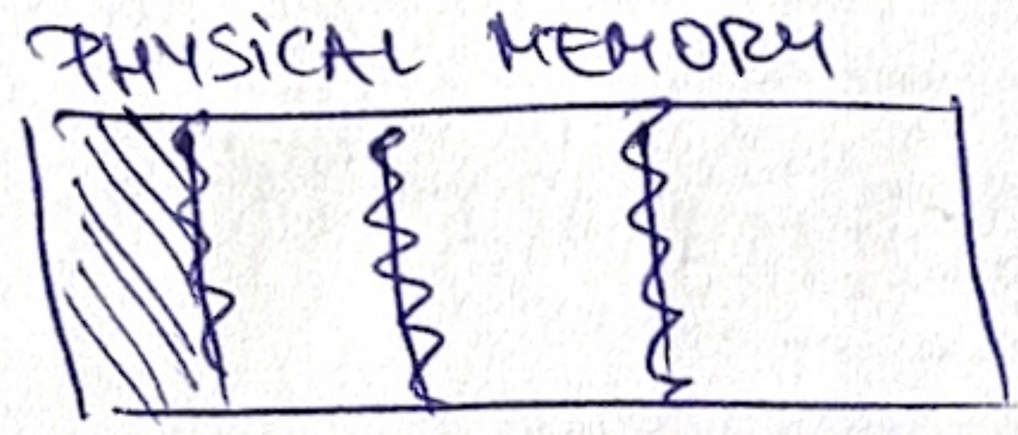


page page

↑

fixed-size blocks.

PHYSICAL MEMORY

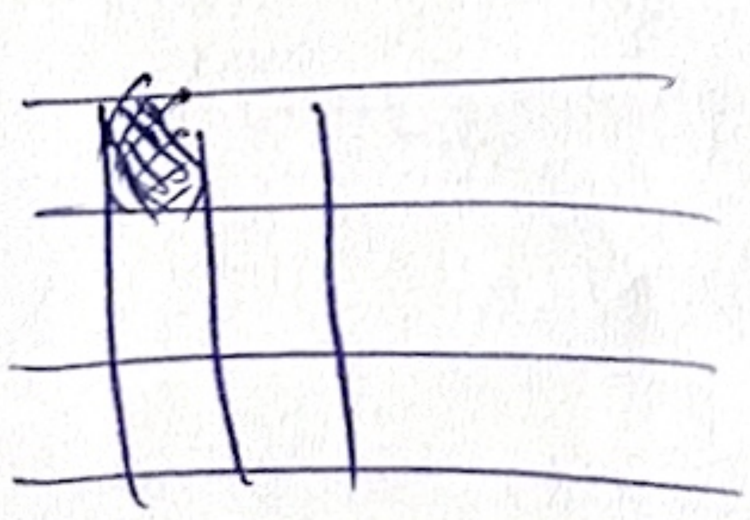


frame frame

↑

fixed-size

PAGE TABLE → associate (map) page nr to frame nr.

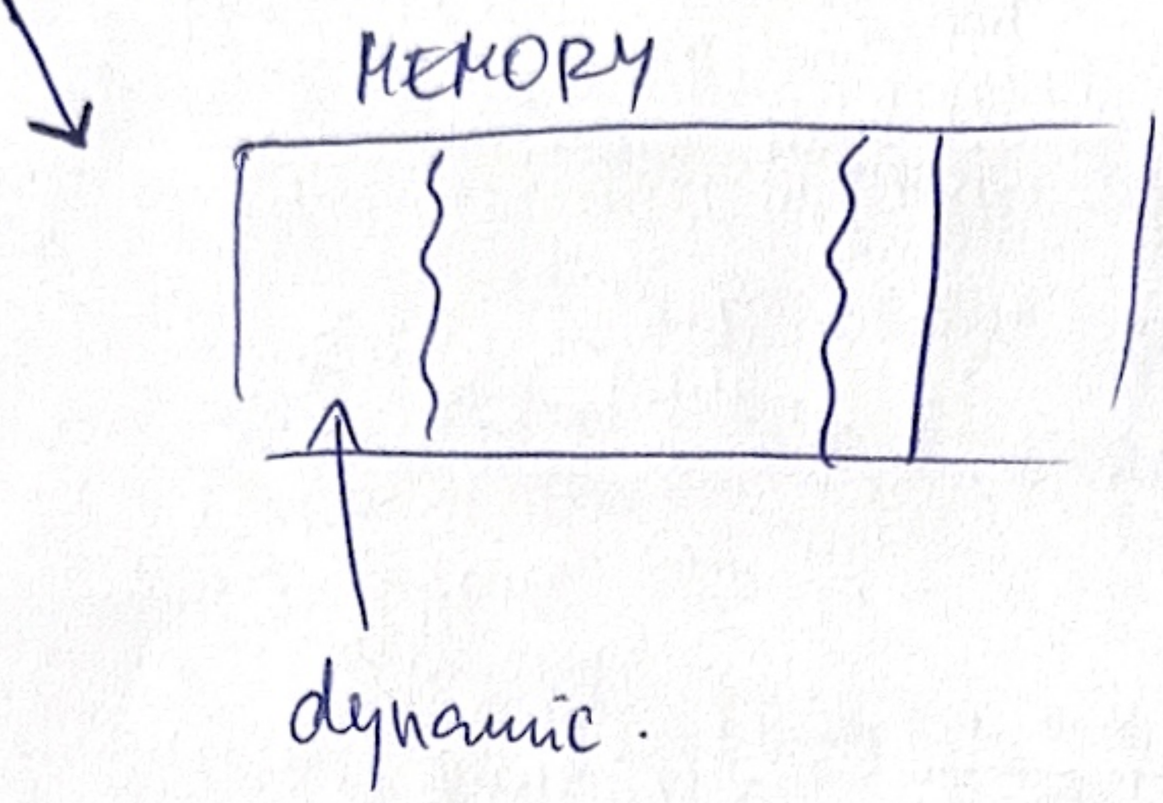


Access paged memory → virtual address : <page, offset>

page → used to look up the frame number in the Page table.

offset → actual memory address.

Variable partition allocation



⑧ First-Fit vs Worst-Fit

First-Fit:
(+) faster than worst fit.
(−) memory fragm.

Worst-Fit:
(+) no holes (fragm)
(−) slower.
